Students's name: Hussein Ibrahimli

Instructor's name: Şamil Hümbətov

Course Title: Fundamentals of Programming

Github repository link: https://github.com/Tesseract009/Python-Lab1-ConditionalStatements

The repo includes 4 python files.

There are 3 individual projects inside this repo:

- **BMI Calculator:** Accurately calculates BMI index.
- **Chinese Zodiac Sign Determiner:** Determines Chinese zodiac sign based on birth year.
- **Birthday Guesser:** Guesses birthday based on 5 sets of numbers

Note: bmi.py, zodiac.py and birthday.py do not work on their own as their code is included in a function. main.py must be run to import those functions and utilize them.

In the coding phase, I have made use of simple if-else structures, along with if-elif-else chains and more complex if-elif-elif-elif-else conditionals.

Along with these, I have created main.py as a menu system and implemented error handling.
